

CEI's Link to Green Infrastructure

CEI has been managing wet weather with green infrastructure designs for our clients for over a decade now. With elements that capture, infiltrate, evapotranspire and reuse stormwater, CEI projects have pleased clients and won recognition for innovation, sustainability and effectiveness. Now, EPA has recognized CEI's contributions on their new Green Infrastructure website making available various tools to assist with stormwater modeling efforts, water quality impacts and evaluating green infrastructure techniques. CEI's Pollutant Load Reduction Model is available for download and will allow the user to determine how different types of green infrastructure techniques (or stormwater best management practices) can reduce pollutant loads within an area.

The model is available via the U.S. EPA Green Infrastructure website at:
