Stormwater Management

CEI to Assist MassDOT Highway Division Environmental Team in Water Resources

We are pleased to announce that CEI has recently been selected by the MA Department of Transportation (MassDOT) Architects and Engineers Review Board to provide its Highway Division Environmental Section with various water resources evaluation and mitigation services. This assignment will include a variety of professional services like: assisting the agency with evaluation and design of stormwater system retrofits to address impacts to impaired waters, consulting with MassDOT environmental personnel on water resources issues, and assisting the Department to address wildlife passage at transportation corridor stream crossings.

CEI takes pride in its leadership role among New England's consulting engineers and stays on the leading edge of stormwater management technology by using innovative approaches to problem solving. The firm has developed numerous designs for stormwater retrofits to serve public roadways and other public facilities in communities throughout New England. Our expertise has led environmental and transportation agencies to seek our assistance in the research and development of major technical handbooks incorporating state-of-the-art stormwater management techniques.

We look forward to working with MassDOT in their efforts to build upon existing water resources and stormwater management efforts, addressing aquatic and terrestrial wildlife passage at stream crossings, and to help the agency make improvements to state water resources.
